

Individual Retrospective

During this sprint I mainly focused on improving the ratings and reviews system for the marketplace application. I worked on the logic that allows users to rate products while preventing duplicate rating rows from being created in the Supabase database. Instead of inserting multiple ratings for the same purchase, I updated the functionality so that existing ratings are updated correctly. I also worked on connecting seller ratings to profile information by using seller IDs across Supabase tables so that average ratings and total scores can automatically update whenever a review is submitted. While doing this I improved my understanding of database relationships, React state handling, testing, and debugging asynchronous behaviour in the application. Below is my proof of my work for this sprint.
