

During this sprint, I mainly worked on the messaging and chat functionality for our marketplace project. My contributions included improving the realtime messaging system using Supabase subscriptions, fixing the read receipt functionality, and updating the chat interface so messages appear instantly without needing to refresh the page.

One of the main challenges I faced was debugging realtime updates for messages and read receipts. Sometimes the first message in a conversation would not update correctly, especially when testing between localhost and the deployed site. I spent time testing different cases and fixing synchronization issues between the frontend and backend.

Overall, this sprint helped me improve my understanding of realtime systems, asynchronous updates, and debugging frontend/backend interactions. Below is evidence of my contributions to this sprint.

Merge pull request #50 from Dev-astators/feature/messaging-ui
