During this sprint, I focused on implementing the Staff Dashboard and the Sign-In page, with my progress clearly reflected in my commit history (e.g., commits related to “feat: implement Staff Dashboard” and updates to authentication UI). Initially, I struggled with structuring the dashboard and understanding how routing should work across multiple pages. This is evident in my commits where I temporarily removed the BrowserRouter and rendered the StaffDashboard directly just to test functionality. Although this made the page work, I later realized it was not the correct approach because it broke navigation between routes.

Through this process, I learned the importance of maintaining proper routing structure and testing features within the correct application flow rather than bypassing it. I also encountered merge conflicts when integrating my feature branch with main, which forced me to understand how to read and resolve conflicts properly.

My commits show gradual improvement: from basic UI additions to more structured updates and fixes. However, I recognize that my workflow can still improve, especially in writing clearer commit messages and avoiding breaking changes. Overall, this sprint helped me build practical skills in React component design, routing, and version control, and highlighted areas where I need to be more careful and systematic.
