During Sprint 3, I focused on improving the frontend design and overall user experience of the marketplace system. As a team, we made a collective decision that since Sprint 1 and Sprint 2 mainly focused on getting the core functionality working, without paying too much attention to how visually polished or appealing the system looked, this sprint my partner and I would focus on refining the application, polishing existing features, and adding smaller improvements that may have been missed along the way, while the other team members focused on implementing the two new major functionalities.

To improve workflow and structure, we also divided the team into pairs for each functionality, where one person focused on backend development and the other focused on frontend implementation. This greatly improved organization, communication, and clarity regarding responsibilities within the sprint.

My main contributions were designing and implementing the notifications, messaging, and create listing interfaces using React and Tailwind CSS. I focused on responsive layouts, reusable card-based components, consistent styling, and cleaner user interactions using Flexbox layouts, hover effects, and conditional rendering. I also worked on improving the overall visual consistency of the application to make the platform feel more polished and user-friendly.

Additionally, I updated the Sprint 2 process diagrams and created new sequence diagrams for major Sprint 3 workflows such as payment processing and trade facility booking. These sequence diagrams helped represent user actions, backend requests, responses, and overall system interactions more clearly.

One challenge during the sprint was deciding how the in-app notification system should present information to users. After discussion, we decided to structure notifications into “Read” and “Unread” sections for now, while planning future improvements where notifications will also be grouped by notification type and title.

Like every other sprint, I also helped maintain and organize the Trello board by ensuring user stories were properly divided into tasks, assigned to team members, and tracked throughout the sprint.
