

Makubung Tjeding's Individual Sprint Retrospective:

Student number: 2807685

This sprint focused on completing and refining major functionality so that our application became a more complete and usable product. Personally, I worked on the administrative side of the system and contributed to improving both functionality and user experience. I implemented enhancements to the admin dashboard, including improvements to user management and role administration features. I also added sign-out functionality to both the admin and staff dashboards to improve usability and account security. Beyond functionality, I spent time refining components and fixing issues to improve stability and overall polish.

One of the more difficult aspects this sprint was integrating frontend and backend functionality across multiple layers of the system. Some features required coordinating React components, hooks, API routes, backend services, and Supabase database interactions simultaneously. Debugging became challenging because errors often originated from a different layer than where they first appeared. I also encountered issues with role management and data retrieval that required tracing requests through several parts of the architecture before identifying the source of the problem. Ensuring changes worked without breaking existing functionality required careful testing.

If I were to approach this sprint again, I would place more emphasis on planning data flow and integration points before implementation. In several cases, implementing frontend features before fully considering backend requirements led to rework later. I would also write more tests earlier and rely more heavily on a test-driven approach during development instead of leaving much of the validation toward the end.

My work fits into the overall system by supporting administrative control and platform management. The dashboard tools I worked on help manage users and system behaviour while improving security and usability. Since the project now operates as a larger integrated product, these features contribute to making the application feel more complete and production-ready rather than simply a collection of isolated features.
